

Service Health Map (geo-map) — what it is & how to configure it

What it is

The **Service Health Map** is a panel on the **Service Availability & Health** dashboard. It plots Service Manager services on a US map, colored by their latest health state (green = Up, red = Down / Loss of Management, orange = Degraded, yellow = Slightly Degraded).

It is a Grafana enhancement — it is NOT part of the CABI Reports. There is no geo-map in the CABI (CA Business Intelligence / Operational Reports) set; this is an additive capability Grafana provides that the legacy CABI reports did not. It is optional.

On the dashboard the section is labelled:

Service Health Map (optional — click to expand) · Enhancement - not included in CABI

How to turn it on (end user)

The map lives in an expandable section at the bottom of the dashboard:

1. Open the **Service Availability & Health** dashboard.
2. Scroll to the bottom section **"Service Health Map (optional — click to expand) · Enhancement - not included in CABI"**.

1. **Click the section header** to expand/collapse the map.

While collapsed, the map's query does not run, so there is no extra load.

⚠️ How to make a service appear on the map (important — this is a workaround)

Read this before configuring. Grafana needs a latitude/longitude for each service to place it on the map. Spectrum Service Manager has ****no native**

coordinate field, **so this map** re-purposes the service's `Description` field** to carry the coordinates. That is a deliberate workaround, and it has consequences you must understand:

- **Whatever you type in a service's Description is read by the map as its coordinates.** If you also want to use Description for human-readable notes, you can't do both with this approach (see *Proper alternative* below).
- A service appears on the map **only if** its Description contains a valid coordinate pair. Services without one still show in every other panel (stats, tables) — they're simply not pinned on the map.

Exactly what to put in the Description field

Set the service's **Description** to its coordinates in this **exact** format:

```
latitude,longitude
```

- **Decimal degrees only** (e.g. `40.7128`), not degrees/minutes/seconds.
- **Latitude first, longitude second**, separated by a single comma.
- **Negative = West or South.** In the continental US longitude is always negative (e.g. `-74.0060`).
- **Nothing else in the field** — no labels, no spaces-and-text, no trailing notes. The field must contain *only* the two numbers and the comma.

Worked examples (these are the services currently on the map)

Service	Put this in Description	Shows up at
<code>Tixchange-NewYork</code>	<code>40.7128,-74.0060</code>	New York, NY
<code>Tixchange-Miami</code>	<code>25.7617,-80.1918</code>	Miami, FL
<code>Tixchange-SanFrancisco</code>	<code>37.7749,-122.4194</code>	San Francisco, CA
<code>Tixchange</code>	<code>32.7767,-96.7970</code>	Dallas, TX
<code>MicrosoftService</code>	<code>42.3601,-71.0589</code>	Boston, MA

Valid vs invalid

Description value	Result
40.7128,-74.0060	✓ plots in New York
37.7749, -122.4194	✓ plots in San Francisco (a space after the comma is OK)
Core router NYC	✗ no coordinates → not on map
NYC 40.7128,-74.0060	✗ leading text → ignored (must START with the number)
40.7128,-74.0060,HQ	✗ trailing text → the part after the last comma (HQ) is read as longitude and fails
40°42'46"N 74°00'21"W	✗ degrees/minutes/seconds not supported — use decimals

Where to set it in Spectrum

1. Open the **OneClick** console.
2. Select the **service model** (the Service Manager service you want to map).
3. In **Component Detail** → **Information** (Attributes), find the **Description**

attribute.

1. Enter the coordinate pair exactly as above and **save**.
2. Back in Grafana, expand the map (or refresh) — the service now appears.

How to find a location's coordinates

In **Google Maps**, right-click the location → the first item in the menu is the

latitude, longitude pair → click it to copy, then paste into the Description

(remove the space if you like; a space after the comma is tolerated).

Proper alternative (if Description is needed for real text)

Re-purposing Description is a workaround. The clean long-term option is a

dedicated coordinate attribute on the service model (or a separate

landmark/site mapping) that the map query reads instead of Description. If the

client wants this, we can re-point the map's query to that field — the rest of

the panel stays the same. Just let us know the attribute and we'll switch the

source.

Colors (health mapping)

Value	Health	Color
0	Up	green
1	Down	red
2	Degraded	orange
3	Slightly Degraded	yellow
5	Loss of Management	red

Summary for the client

The geo-map is a Grafana enhancement, not a CABI report — none exists in the

CABI/Operational Reports set. It's optional: expand the **"Service Health Map**

(optional)"** section at the bottom of the Service Availability & Health

dashboard. To place a service on the map, set that service's **Description**

field in Spectrum to its coordinates as `latitude,longitude` (e.g.

`40.7128,-74.0060` for New York) — and *only* that, since the map reads the

whole Description as coordinates. This re-uses the Description field as a

workaround; if you need Description for notes instead, we can switch the map to

a dedicated coordinate attribute.
