

Service Health Map (geo-map)

Service Availability & Health · Operational Reports / Service-SLA Reports · 2026-08-28

Rebuilt 2026-08-28. This panel used to plot *services*, using a hacked coordinate value in each service's Description field. That approach was removed 2026-06-30 at the client's request — not a rejection of the map itself, but of *how* it sourced coordinates. It's back, rebuilt to plot *customer sites* using a real Spectrum field instead. If you're looking for the old service-Description approach, it no longer exists — don't re-add it.

What it is

The **Service Health Map** is a panel on the **Service Availability & Health** dashboard. It plots **customer sites** on a US map — one pin per customer, not per service — colored by that customer's worst current health across whichever services are in scope. It respects the dashboard's existing **Service** and **Customer** filters, exactly like every other panel here.

Hover a pin to see why it's that color. The tooltip has two tabs:

- **Customer Site** (left, shown by default) — the customer name and its worst current health, matching the pin's color and the **Current Health** wording used in the Service Availability & Health table above (Up / Maintenance / Slightly Degraded / Degraded / Down / Loss Of Management).
- **Services** (right) — every service used at that site, each with its own health, worst first. This answers the question the map's color alone can't: *which* service is dragging this site down. If a site has more than one service, they list as an expandable group on this tab.

There's no separate service picker for the map — it uses the same **Service** dropdown at the top of the dashboard that every other panel on this page does.

It is a Grafana enhancement — it is NOT part of the CABI Reports. There is no geo-map in the CABI (CA Business Intelligence / Operational Reports) set; this is an additive capability Grafana provides that the legacy CABI reports did not. On the dashboard the section is labelled:

Service Health Map (optional) · Enhancement – not included in CABI

It's expanded by default — no click needed to see it. ("Optional" describes that it's a Grafana-only addition with no CABI equivalent, not that it's hidden.)

Why customer sites, not services

A service can be used by several customers in several places — the motivating example: one shared app used by ten customer locations, four of which are having trouble. A *per-service* pin can't show that; it collapses ten sites into one dot. A *per-customer* pin can, and it also gives a diagnostic read for free:

- **Most or all of a service's customer-sites are red** → look at the service itself — this points at a shared/central cause.
- **A handful of sites are red, most are fine** → look at those specific sites — this points at something local to them, not the shared service.

Filter the dashboard's **Service** variable to one service and the map narrows to just that service's customer footprint, making this read immediate.

Known gotcha with this demo's data: if a service has been split into several site-specific stand-ins (this environment has `Tixchange` , `Tixchange-Miami` , `Tixchange-NewYork` , `Tixchange-SanFrancisco` as four separate service objects, each tied to at most one customer), filtering to the general/umbrella name alone may show far fewer — or zero — sites than you expect, because the customer associations live on the site-specific objects, not the umbrella one. Check **Service Detail** → **Customers Using This Service** for the service you're filtering to before concluding the map is wrong.

How a customer site appears on the map

Coordinates come from the **Customer's** own **Primary Contact Location** field (falling back to **Secondary Contact Location** if Primary is empty). This is a real, existing Spectrum Service Manager attribute — nothing is hacked onto an unrelated field this time. A customer with neither field populated simply doesn't appear on the map; every other panel on the dashboard is unaffected.

Exactly what to put in the field

Set the customer's **Primary Contact Location** (or **Secondary**) to its coordinates in this **exact** format:

```
latitude,longitude
```

- **Decimal degrees only** (e.g. `40.7128`), not degrees/minutes/seconds.
- **Latitude first, longitude second**, separated by a single comma.
- **Negative = West or South**. In the continental US longitude is always negative (e.g. `-74.0060`).
- **Nothing else in the field** — no labels, no trailing notes. A space immediately after the comma is fine; anything else in the field is not.

Worked examples (the three real customers currently on the map)

CUSTOMER	PRIMARY CONTACT LOCATION	SHOWS UP AT
<code>Miami-Users</code>	<code>25.7617,-80.1918</code>	Miami, FL
<code>NewYork-Users</code>	<code>40.7128,-74.0060</code>	New York, NY
<code>SanFrancisco-Users</code>	<code>37.7749,-122.4194</code>	San Francisco, CA

Valid vs invalid

FIELD VALUE	RESULT
<code>25.7617,-80.1918</code>	Valid plots in Miami
<code>37.7749, -122.4194</code>	Valid plots in San Francisco (a space after the comma is OK)
<code>Miami office</code>	Invalid no coordinates → not on map
<code>HQ 25.7617,-80.1918</code>	Invalid leading text → ignored (must START with the number)
<code>25.7617,-80.1918,HQ</code>	Invalid trailing text → the part after the last comma (<code>HQ</code>) is read as longitude and fails
<code>25°45'42"N 80°11'30"W</code>	Invalid degrees/minutes/seconds not supported — use decimals

Where to set it in Spectrum

1. Open the **OneClick** console.

- 2. Navigate to **Customers** and select the **SM_Customer** you want to map (e.g. **Miami-Users**).
- 3. In **Component Detail** → **Information** → **Contact Information**, find **Primary Contact Location** (or **Secondary Contact Location**).
- 4. Enter the coordinate pair exactly as above and **save**.
- 5. Back in Grafana, refresh the dashboard — the customer now appears.

How to find a location's coordinates

In **Google Maps**, right-click the location → the first item in the menu is the **latitude, longitude** pair → click it to copy, then paste into the field (a trailing space after the comma is tolerated).

Colors (health mapping)

The map colors each customer by the **worst** health status among their in-scope services (Up is best, Down/Loss of Management tied for worst):

HEALTH	COLOR
Up	 Green
Maintenance	 Blue
Slightly Degraded	 Yellow
Degraded	 Orange
Down	 Red
Loss Of Management	 Red

History

- **Original version:** one pin per service, coordinates hacked into the service's **Description** field. Removed 2026-06-30 ("Remove geo-map section (client request)") because of that mechanism, not the map itself.
- **Current version (2026-08-28):** one pin per customer site, coordinates read from the Customer's own Primary/Secondary Contact Location field, and scoped by the dashboard's existing Service/Customer filters. Query joins **sm_customers** → **sm_customer_mhs** → **sm_slmuses** → **sm_monitors** , the same customer↔service link every other panel on this dashboard already uses.
- **Reviewer refinement pass (2026-08-28, same day):** first review round flagged the legend as reading like a raw impact count rather than the same health vocabulary as the **Current Health** column above it — fixed by mapping the pin color to that same Up/Maintenance/Slightly Degraded/Degraded/Down enum. Second round asked to see which service is behind a red pin without leaving the map — added the **Services** tab described above, sorted worst-to-best, to the right of **Customer Site**.
